

Flychart 4.52

This document pertains to FlyChart installations 4.52.24 or later.

Reset the Registry

Due to different user-access rights in Windows Vista, it was necessary to change the installation procedure and the file structure of FlyChart. This change starts with version 4.52.14. If previous version were installed on your computer, it is possible that there are wrong registry settings and file structures in the registry. The structure and settings cannot be automatically set with the FlyChart installer because this would adversely affect any previous FlyChart installations.

It is possible that, after installing FC in Vista and attempting to launch FC, you may receive an error message that FC could not find the file Flychart.fcdb. Alternatively, FlyChart may start normally but gives the message that the instrument doesn't match the Default configuration. In this case, the small application FlyChart_Force_First_Start.reg can be used to fix the registry. It can be downloaded from www.flytec.ch or www.flytec.com

Instructions

- Exit FlyChart
- Download the Zip Archive FlyChart_Force_First_Start.reg from our website
- Unpack the Zip archive to a place where you can find it (e.g. the desktop)
- You can also start the application directly from the Zip archive by double clicking on FlyChart_Force_First_Start.reg
- Running Windows XP You will be asked, if you like to add the information. Confirm with "Yes". Running Vista you will be asked to confirm two times.
- After that you can restart Flychart. It should start up like it was installed from scratch.
